

In-wall activity

Meridian, long-time advocate of active loudspeakers, has brought this approach to the in- and on-wall marketplace with a range of three models. One of the biggest problems with in-walls is that the tweeter cannot be oriented for best stereo results at the listening position.

Meridian has got around this with a wide dispersion ribbon tweeter, horn loaded to aid efficiency and give it the power to penetrate wall coverings or grilles. The company achieves active operation by installing the amplification in a separate outboard case that can be rack mounted with the system electronics. The G41 Powered

Crossover provides 8x100 watts and is configured for different models in the speaker range with slot in cards. Those with solid walls can use Meridian's 'W' on-wall range.
