Fitting 101 Control Unit Double Module

1. Switch off your control unit and unplug from the mains before attempting to fit the double module.
2. Take great care when fitting the double module. On the main printed circuit board there are components which stick up from the board underneath the module. Holes have been made in the module to make way for these components. It is essential that the module be offered up to the preamp so that these components do not touch the printed circuit track of the module. It is also, of course, that all 8 legs of the module feet fit into the appropriate sockets in the control unit.
